

Obsidian plugin
src/main.ts
commands · report view · review modal · spend dialog

Headless CLI
src/cli/index.ts
compile · check · roundtrip · status

the seam that lets 113 tests run with no vault, no Obsidian, no network and no API key

The diagram shows four boxes arranged horizontally, representing the components of a book:

- Spine note**: order · parts · metadata
- Chapter notes**: markdown, as written
- Figures**: png · jpg · svg
- Bibliography**: BibTeX · .bib

0 operations

.manuscript-cache/manifest.json per-chapter hashes · cached tokenised HTML · figure URLs · resume point

every chapter gets exactly one verdict per compile, and the compiler can prove each

real page breaks · footnotes as out-of-flow parts · hosted figure URLs · anchors for the contents and every cross-reference

Self-contained HTML proof
No key. No network. No cost.
0 operations

images/upload-base64	content-addressed, uploaded once
documents/export	PDF + DOCX, page breaks and footnotes intact

0 operations — exports and image uploads are not billable

1 operation each

THREE DECISIONS THAT SHAPED IT

Order, numbering and citations have one right answer. A model makes them dearer and non-repeatable.

Costs one extra pass; buys a recompile that can name exactly which chapters moved, and prove it.

Costs uglier ids: buys reordering a book that re-renders nothing at all.

4 / 500
ops, whole project
